Molecular Modeling

1. Model building
2. Molecular Dynamics Simulation
3. **Analysis** of the
 - model
 - results of the simulation

NIH Resource for Biomolecular Modeling and Bioinformatics
<http://www.ks.uiuc.edu/>

Beckman Institute, UIUC

Collection of MD Data

- DCD trajectory file
 - coordinates for each atom
 - velocities for each atom
- Output file
 - global energies
 - temperature, pressure, ...

NIH Resource for Biomolecular Modeling and Bioinformatics
<http://www.ks.uiuc.edu/>

Beckman Institute, UIUC

Analysis of MD Data

1. Structural properties
2. Equilibrium properties
3. Non-equilibrium properties

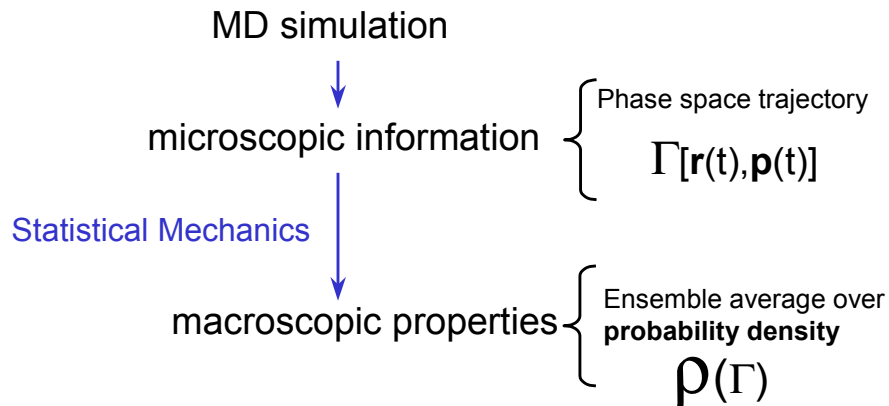

Can be studied via both **equilibrium** and **non-equilibrium** MD simulations

Statistical Ensemble

Collection of *large* number of replicas (on a macroscopic level) of the system

Each replica is characterized by the same macroscopic parameters (e.g., NVT, NPT)

The microscopic state of each replica (at a given time) is determined by Γ in phase space

Time vs Ensemble Average

For $t \rightarrow \infty$, $\Gamma(t)$ generates an ensemble with

$$\rho(\Gamma)d\Gamma = \lim_{t \rightarrow \infty} d\tau / t$$

Ergodic Hypothesis: Time and Ensemble averages are equivalent, i.e., $\langle A(r, p) \rangle_t = \langle A(\Gamma) \rangle_\rho$

Time average: $\langle A \rangle_t = \frac{1}{T} \int_0^T dt A[\mathbf{r}(t), \mathbf{p}(t)]$

Ensemble average: $\langle A \rangle = \int d\Gamma \rho(\Gamma) A(\Gamma)$

Thermodynamic Properties from MD Simulations

Thermodynamic (equilibrium) averages can be calculated via time averaging of MD simulation time series

$$\langle A \rangle \approx \frac{1}{N} \sum_{i=1}^N A(t_i)$$

Thermodynamic average \swarrow \nwarrow MD simulation time series

Finite simulation time means incomplete sampling!

Common Statistical Ensembles

1. Microcanonical (N,V,E):

$$\rho_{NVE}(\Gamma) \propto \delta[H(\Gamma) - E] \quad \leftarrow \text{Newton's eq. of motion}$$

2. Canonical (N,V,T):

$$\rho_{NVT}(\Gamma) = \exp\{[F - H(\Gamma)]/k_B T\} \quad \leftarrow \text{Langevin dynamics}$$

3. Isothermal-isobaric (N,p,T)

$$\rho_{NPT}(\Gamma) = \exp\{[G - H(\Gamma)]/k_B T\} \quad \leftarrow \text{Nose-Hoover method}$$

Different simulation protocols $[\Gamma(t) \rightarrow \Gamma(t+\delta t)]$ sample different statistical ensembles

Examples of Thermodynamic Observables

- Energies (kinetic, potential, internal, ...)
- Temperature [*equipartition theorem*]
- Pressure [*virial theorem*]

Thermodynamic derivatives are related to mean square fluctuations of thermodynamic quantities

- Specific heat capacity C_V and C_P
- Thermal expansion coefficient α_P
- Isothermal compressibility β_T
- Thermal pressure coefficient γ_V

NIH Resource for Biomolecular Modeling and Bioinformatics

Beckman Institute, UIUC

Mean Energies

Total (internal) energy: $E = \frac{1}{N} \sum_{i=1}^N E(t_i)$ **TOTAL**

Kinetic energy: $K = \frac{1}{N} \sum_{i=1}^N \sum_{j=1}^M \frac{p_j^2(t_i)}{2m_j}$ **KINETIC**

Potential energy: $U = E - K$ **BOND
ANGLE
DIHED
IMPRP
ELECT
VDW**

Note: You can conveniently use `namdplot` to graph the time evolution of different energy terms (as well as T, P, V) during simulation

NIH Resource for Biomolecular Modeling and Bioinformatics
<http://www.ks.uiuc.edu/>

Beckman Institute, UIUC

Temperature

From the equipartition theorem $\langle p_k \partial H / \partial p_k \rangle = k_B T$

$$T = \frac{2}{3Nk_B} \langle K \rangle$$

Instantaneous *kinetic temperature*

$$T = \frac{2K}{3Nk_B} \quad \text{namdplot TEMP vs TS ...}$$

Note: in the NVTP ensemble $N \rightarrow N - N_c$, with $N_c = 3$

NIH Resource for Biomolecular Modeling and Bioinformatics
<http://www.ks.uiuc.edu/>

Beckman Institute, UIUC

Pressure

From the virial theorem $\langle r_k \partial H / \partial r_k \rangle = k_B T$

$$PV = Nk_B T + \langle W \rangle$$

The *virial* is defined as

$$W = \frac{1}{3} \sum_{j=1}^M \mathbf{r}_j \cdot \mathbf{f}_j = -\frac{1}{3} \sum_{i,j>i} w(r_{ij})$$

← pairwise interaction

with $w(r) = r \, dv(r) / dr$

Instantaneous *pressure* function (not unique!)

$$\mathcal{P} = \rho k_B T + W / V$$

Beckman Institute, UIUC

Thermodynamic Fluctuations (TF)

$$\langle \delta A \rangle \approx \frac{1}{N} \sum_{i=1}^N [A(t_i) - \langle A \rangle]$$

Mean Square Fluctuations (MSF)

$$\langle \delta A^2 \rangle = \langle (A - \langle A \rangle)^2 \rangle = \langle A^2 \rangle - \langle A \rangle^2$$

According to *Statistical Mechanics*, the probability distribution of thermodynamic fluctuations is

$$\rho_{fluct} \propto \exp\left(\frac{\delta P \cdot \delta V - \delta T \cdot \delta S}{2k_B T}\right)$$

NIH Resource for Biomolecular Modeling and Bioinformatics

Beckman Institute, UIUC

TF in NVT Ensemble

In MD simulations distinction must be made between properly defined mechanical quantities (e.g., energy E , kinetic temperature T , instantaneous pressure \mathcal{P}) and thermodynamic quantities, e.g., T , P , ...

For example: $\langle \delta E^2 \rangle = \langle \delta \mathcal{H}^2 \rangle = k_B T^2 C_V$ ✓

But: $\langle \delta \mathcal{P}^2 \rangle \neq \langle \delta P^2 \rangle = k_B T / V \beta_T$ ✗

Other useful formulas:

$$\langle \delta K^2 \rangle = \frac{3N}{2} (k_B T)^2$$

$$\langle \delta U^2 \rangle = k_B T^2 (C_V - 3Nk_B / 2)$$

$$\langle \delta U \delta \mathcal{P} \rangle = k_B T^2 (\gamma_V - \rho k_B)$$

$$C_V = (\partial E / \partial T)_V$$

$$\gamma_V = (\partial P / \partial T)_V$$

NIH Resource for Biomolecular Modeling and Bioinformatics
<http://www.ks.uiuc.edu/>

Beckman Institute, UIUC

TF in NPT Ensemble

$$\langle \delta V^2 \rangle = V k_B T \beta_T$$

$$\langle \delta (\mathcal{H} + PV)^2 \rangle = k_B T^2 C_P$$

$$\langle \delta V \delta (\mathcal{H} + PV) \rangle = k_B T^2 V \alpha_P$$

By definition: $\alpha_T = V^{-1} (\partial V / \partial T)_P$; $\beta_T = -V^{-1} (\partial V / \partial P)_T$
 $C_P = (\partial E / \partial T)_P$

NIH Resource for Biomolecular Modeling and Bioinformatics
<http://www.ks.uiuc.edu/>

Beckman Institute, UIUC

How to Calculate C_V ?

1. From definition

$$C_V = (\partial E / \partial T)_V$$

Perform multiple simulations to determine $E \equiv \langle E \rangle$ as a function of T , then calculate the derivative of $E(T)$ with respect to T

2. From the MSF of the total energy E

$$C_V = \langle \delta E^2 \rangle / k_B T^2$$

with $\langle \delta E^2 \rangle = \langle E^2 \rangle - \langle E \rangle^2$
