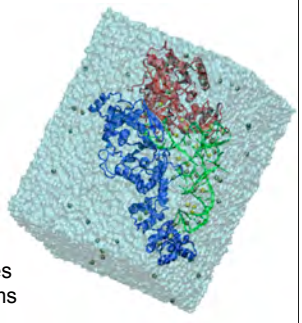
Molecular Dynamics Simulations

MD performed with NAMD2 (1) - System Setup



Simulation Parameters

Minimization: 290,000 steps
Production run: 108 ns
Forcefields: CHARMM27 (2), AMBER (3)
Time step: 1 fs
VdW frequency: 2 fs
VdW cutoff: 12 Å
Switching distance: 10 Å
Pair list distance: 14 Å
Particle Mesh Ewald
Full electrostatic update: 4 fs
Ensemble: NPT
Langevin temperature: 298.15 K
Langevin pressure: 1 atm
Periodic boundary conditions

Contents of System(4)

GluRS
Glu-tRNA^{Glu}
EF-Tu
GTP
Ions: Mg^{2+}, K^{+}
H_2O: ~27,000 molecules
System: ~130,000 atoms

System Perturbations

Deprotonation/protonation of reactants (aa,NTs)
Changing rotamer states of residues (5) involved in long-lived salt bridges

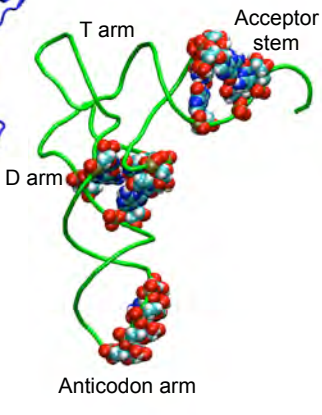
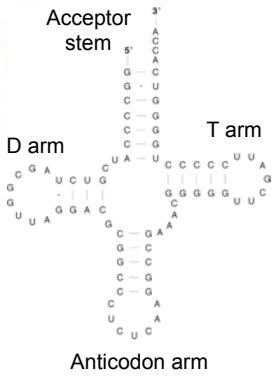
Charging tRNA through allosteric signaling

Identity Elements

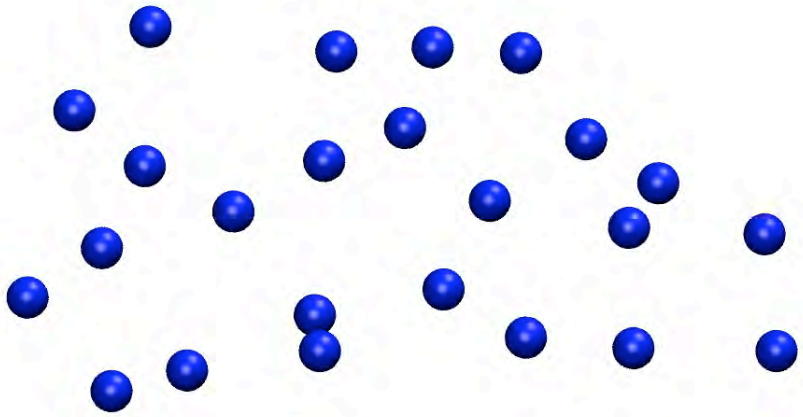




Overall Charging Reaction

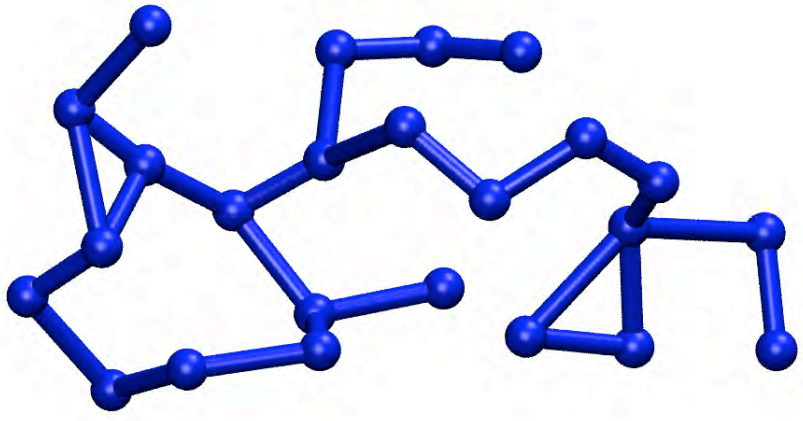
$$ATP + Glu + tRNA \xrightarrow{GluRS} Glu\text{-}tRNA + AMP + PP_i$$

How to Construct a Network?



Nodes - defined at C_a (protein) and P (nucleotide) atoms

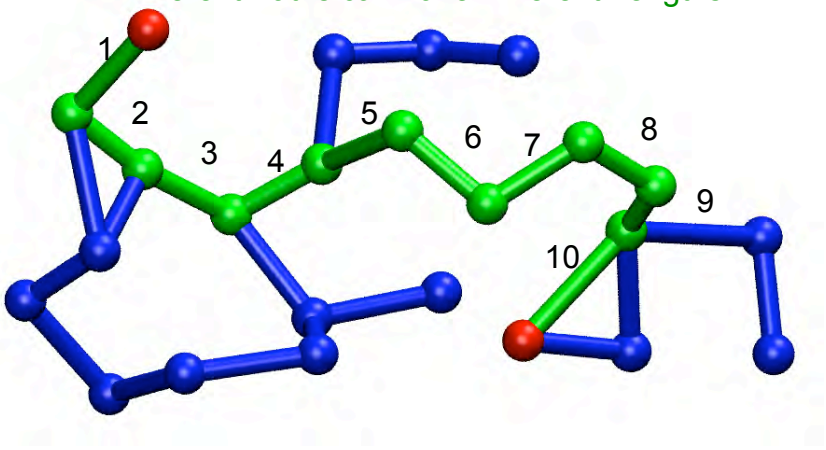
How to Construct a Network?



Edges - connect nodes that are within a contact distance threshold for more than 75% of an MD trajectory

Communication between Identity Elements and Site of Chemistry

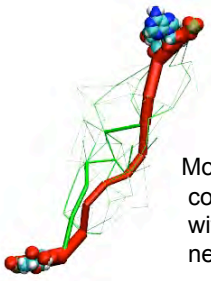
Different Paths can have Different Lengths



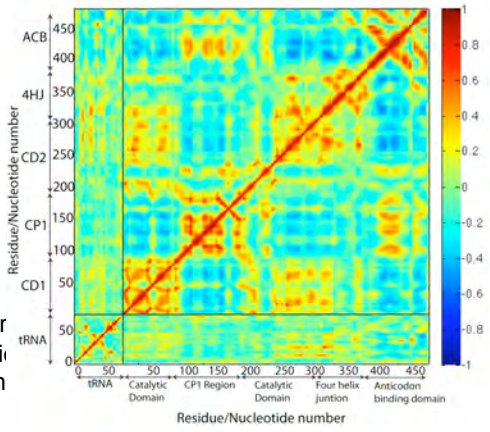
Path length = 10 (*unweighted*)

Information transfer? ***Weight contacts/links by correlations !***

Correlations (C_{ij}) define signaling pathways in GluRS:tRNA

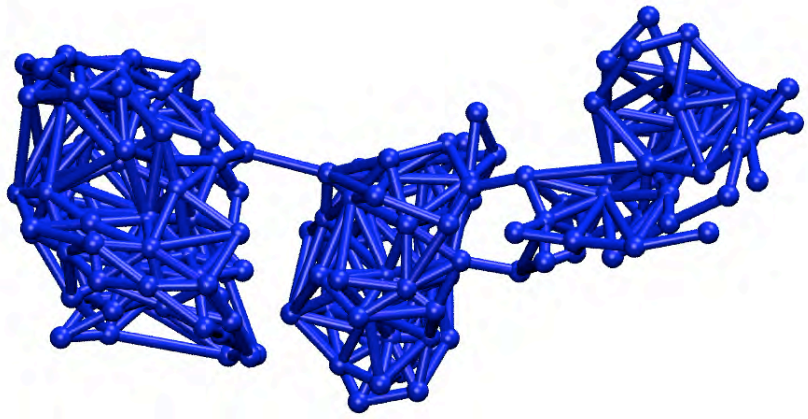


Modular str
communiti
with weigh
network

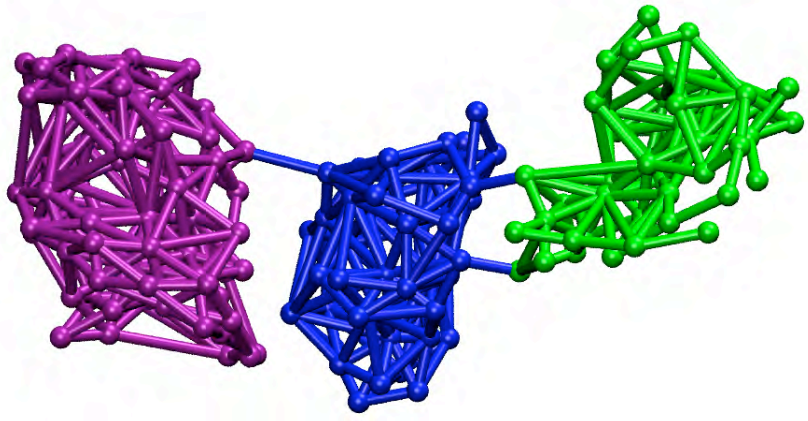


- MD simulations run with NAMD
- NTP ensemble
- Neutralized with Mg^{2+} and K^{+}
- C_{ij} values calculated over a 16-ns window

Nodes Cluster Together in Modules called Communities



Nodes Cluster Together in Modules called Communities



Communities are subnetworks with many intracommunity edges but few intercommunity edges.

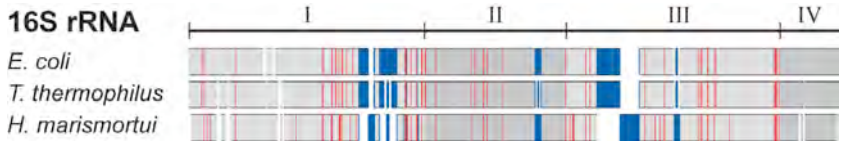
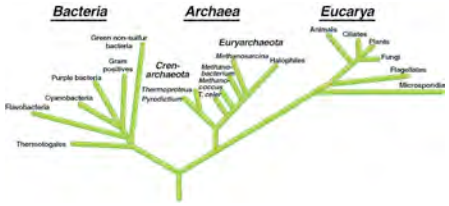
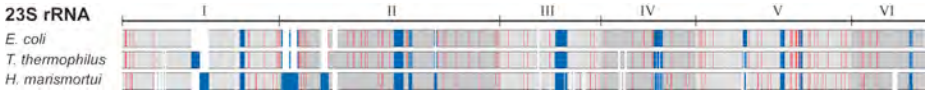
Sequence and **Structure** Signatures in Ribosomal RNA



Ribosomal Signatures: Idiosyncrasies in rRNA and/or rproteins characteristic of the domains of life

69 (119) & **6 (14)** in 16S (23S)





Roberts, Montoya, Sethi, Woese, ZLS, *PNAS* 2008

Signature analysis

- Signatures are sequence and/or structural features that are characteristic of a domain of life*.
- Identify the sequence signatures in the 16S rRNA and proteins using MultiSeq
- MultiSeq has a coloring based on signatures, but use Scripts to collect quantitative data about the signatures: position, composition.

* E. Roberts, A. Sethi, J. Montoya, C. Woese, Z Luthey-Schulten (2008) *PNAS*

Signature analysis script

```
proc get_taxa_signatures {args} {

    initializeMultiSeqEnvironment

    # Load the alignment.
    set sequenceIDs [::SeqData::Fasta::loadSequences $alignmentFilename]

    # Find the reference species.
    set refSequenceIDs {}
    foreach species $referenceSpecies {
        set found 0
        foreach sequenceID $sequenceIDs {
            if {[string toupper [::SeqData::getScientificName $sequenceID]] == [string toupper $species]} {
                lappend refSequenceIDs $sequenceID
                set found 1
                break
            }
        }
    }

   # Group the sequence ids.
    array set groupData {names {}}
    foreach sequenceID $sequenceIDs {

        set group ""
        if {$rankName == "domain"} {

        }
    }
}
```

90,000 Environmental 16S rRNA
Distinct A & B Sequence Signatures

- Analysis of the ribosomal signatures in 90,000 new environmental samples shows that no "gray" area exists: a ribosome is either bacterial or archaeal in nature.
- Split across cluster: 10,000 sequence on each node
